#### **Conclusions**

Based upon the findings of this report, it was determined that the proposed rezoning and future development of Santa Barbara Boulevard & Golden Gate Parkway Commercial Sub-District will not have a negative impact upon the surrounding road network. It was verified that all roads, within the project's area of influence, currently have a surplus of capacity and can accommodate the traffic associated with the proposed mixed-use development that may consist of a K thru 12 charter school, a gas-n-convenience store, a fast food restaurant, and a miscellaneous commercial retail land use. As determined, the road network will continue to operate at acceptable levels of service for 2021 project build-out conditions and will not create any off-site transportation deficiencies that need to be mitigated.

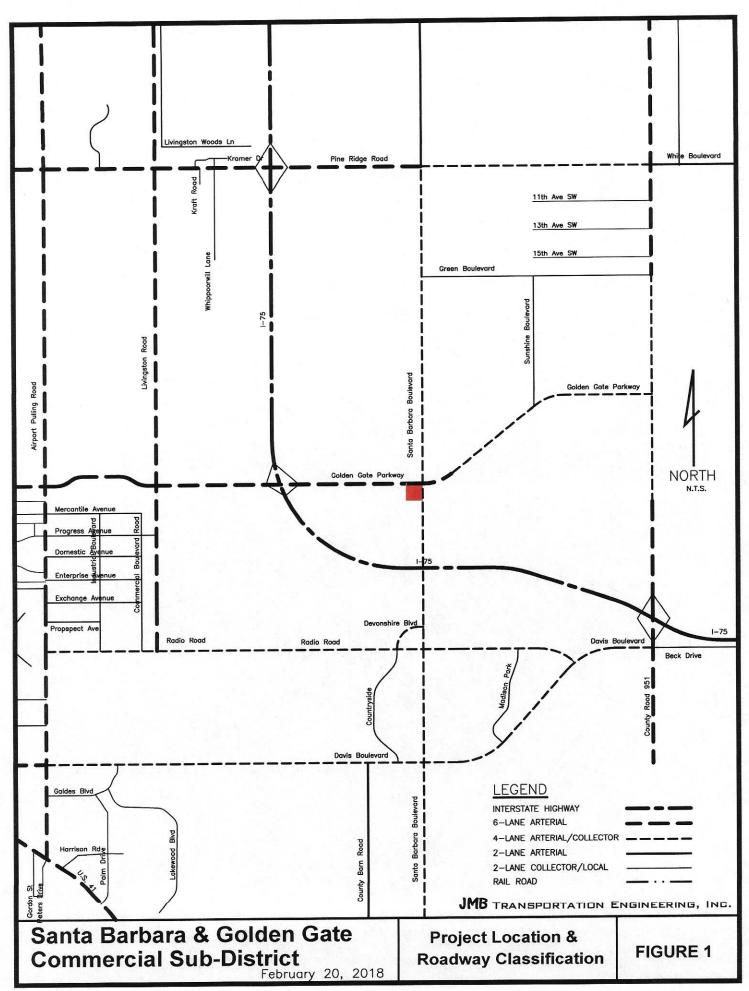

Note, site access conditions and off-site intersection impacts/mitigation will be evaluated at the time of acquiring SDP approval.

**Scope of Project** 

Santa Barbara Boulevard & Golden Gate Parkway Commercial Sub-District is a proposed multi-use project that may consist of a K thru 12 charter school (1400 students), a gas-n-convenience (9,000 s.f. store & 16 fueling positions), a fast food restaurant w/drive thru (6,000 s.f.), and 6,500 s.f. of retail/office. The site is located on the southwest corner of Santa Barbara Boulevard & Golden Gate Parkway, within Collier County, Florida. It is proposed to have two (2) points of access on Santa Barbara Boulevard and one (1) access on Golden Gate Parkway. The northern access on Santa Barbara is intended to serve the commercial uses and will be restricted to right-in/out access and the southern access will primarily serve the charter school and will be a directional left-in median opening. It is expected that commercial trips from south will also use this access. The access on Golden Gate Parkway will be a left-in median opening and will be shared by the school and commercial land uses.

Table A
Proposed Land Uses

	Land Oses
Proposed Land Uses	Number of Units or Size
Charter School (K thru 12)	1,400 Students
Retail/Office	5,000 s.f.
Fast Food w/ Drive-Thru	5,000 s.f.
Gas n Convenience Store	7,000 s.f. & 16 Fuel Positions

**Project Generated Traffic** 

Traffic that can be expected to be generated by the project was estimated based upon the guidelines established by the Institute of Transportation Engineers, Trip Generation Manual, 10<sup>th</sup> Edition. That is, historical traffic data collected at similar land uses was relied upon in estimating the project's traffic. It was determined that land use code "Charter School K-12" (LUC 537), Variety Store" (LUC 814), "Fast Food w/ Drive-Thru" (LUC 934), and "Super Convenience/Gas station" (LUC 960) were most representative of the most intense land uses that could be developed.

As agreed to with staff, the school's PM peak hour trips were estimated based upon the "highest peak hour generator", which mostly occur before 4:00 PM. Therefore, the trips were reduced by 50% to reflect trips on the network between the hours of 4-6 PM. Also, the site currently has an existing private school of 150 students. Therefore, trip estimates were performed for the existing, proposed and net new trips associated with the school land use.

The total estimated commercial trips were adjusted for pass-by trips and also it was estimated that 15% of the "new" commercial trips would be captured trips that will be generated by the charter school.

Table 1 provides a detail of the total estimated trips and adjustments discussed above.

As determined, the project could generate 6,043 daily trips and 1,856 vph and 699 vph new trips during the AM and PM peak hours, respectively.

Table B
New Site-Generated Trips
(Summation of Table 1)

Daily New Weekday Trips Generated (ADT)	New AM Peak Hour Trips Generated (vph)	New PM Peak Hour Trips Generated (vph)

**Existing + Committed Road Network** 

Figure 1 and Table 2A provide a detail of the surrounding E+C road network. Table 2A also shows the roads' respective minimum level of service performance standards and capacity. As shown, there are no significant 5-year committed roadway improvements within the project's area of impact. However, the .

Santa Barbra Boulevard varies from a four-lane to a six-lane major arterial that has a north/south orientation between its southern terminus at its intersection with Rattlesnake Hammock Road and its northern terminus at its intersection with Green Boulevard where the roadway continues north to Immokalee Road and is known as Logan Boulevard. Between Green Boulevard and Golden Gate Parkway, Santa Barbara Boulevard is classified as a four-lane divided arterial having a maximum service capacity of 2,100 vphpd. Between Golden Gate Boulevard and Rattlesnake Hammock Road, Santa Barbara Boulevard is classified as a six-lane divided arterial having a maximum service capacity of 3,100 vphpd. Within proximity of the site, the posted speed limit of Santa Barbara Boulevard is 45 MPH.

Golden Gate Parkway varies from a four-lane to a six-lane major arterial that has an east/west orientation between its western terminus at its intersection with U.S. 41 and its eastern terminus at its intersection with Collier Boulevard. Golden Gate Parkway (west of Santa Barbara Boulevard), is classified as a six-lane divided arterial having a maximum service capacity of 3,300 vphpd. Golden Gate Parkway (east of Santa Barbara Boulevard) is classified as a four-lane divided arterial having a maximum service capacity of 1,800 vphpd. Within proximity of the site, the posted speed limit of Golden Gate Parkway is 45 MPH.

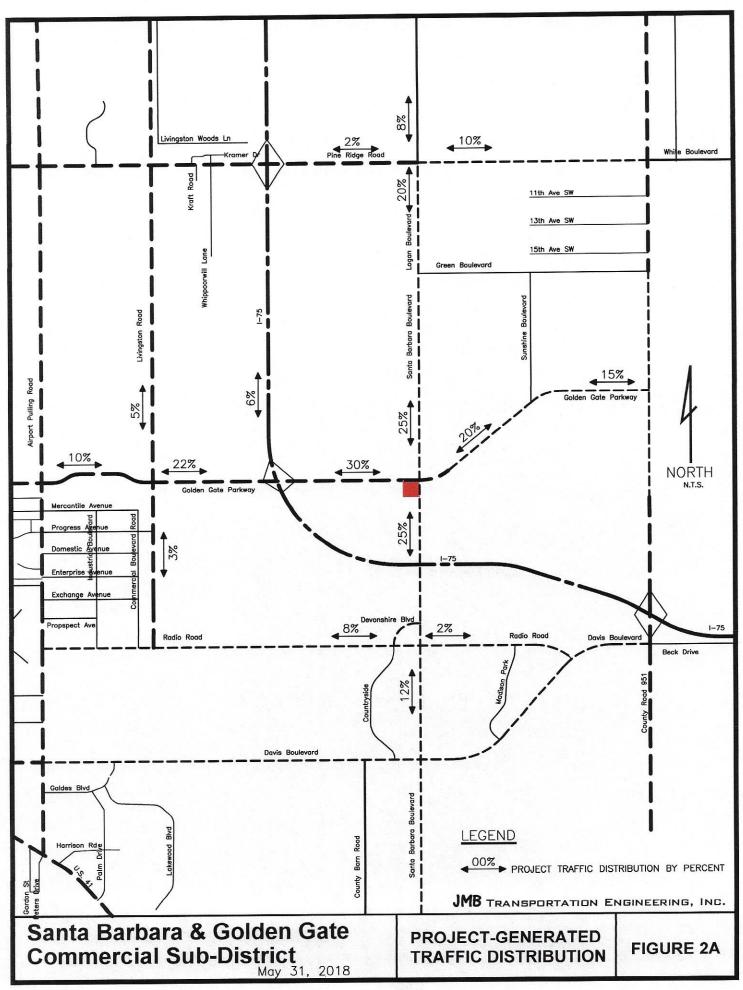

**Project Traffic Distribution** 

The project's traffic was distributed to the surrounding road network based upon logical means of ingress/egress, current and future traffic patterns in the area, and the location of surrounding residential areas as well as other schools was considered. Figure 2A and Table 2A provide a detail of the traffic distributions based on a percentage basis. Figure 2B and Table 2A depict the trip assignments to the site access and nearby intersections.

As shown on Table 2A, the report estimates that the trips associated with the fast food (LUC 934) and the gas-n-convenience store (LUC 960) will have a 50% absorption of their trips within the a 2-mile radius of the site.

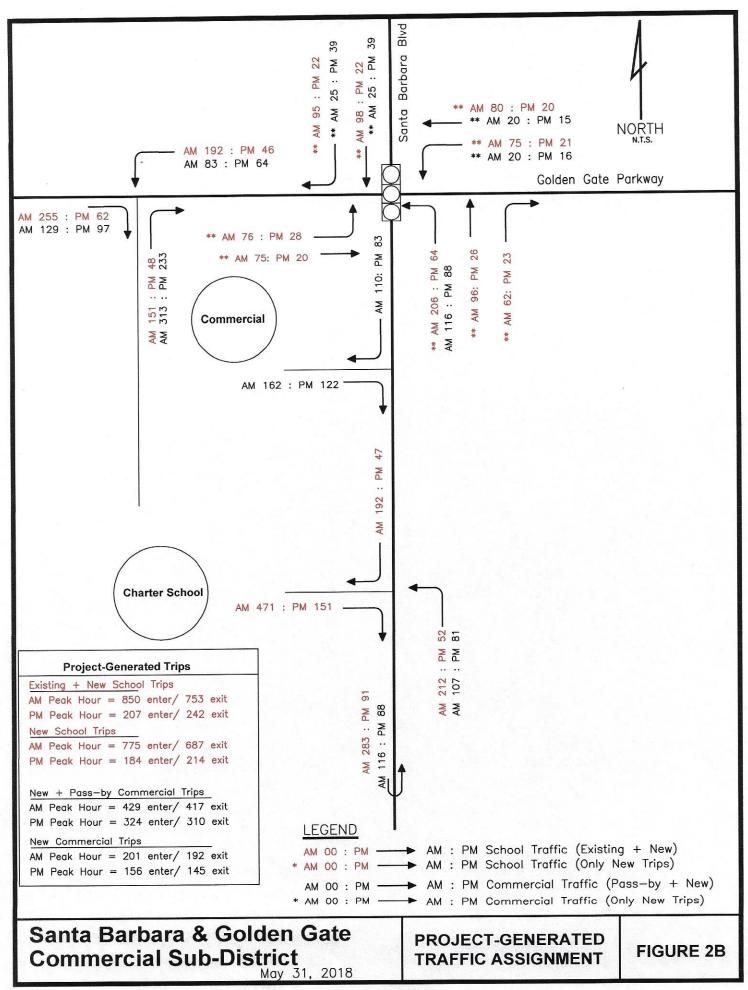

Area of Significant Impact

The area of significant impact was determined based upon Collier County's 2%, 2% and 3% criteria (i.e., if the project's traffic is 2% or more of a roadway's adopted level of service capacity, then the project has a significant impact upon that link). Table 2A describes the project traffic distributions and the level of impact on the surrounding roadways. Roads that were identified as being within the projects area impact are identified in Table 2A.

2017 thru 2021 Project Build-out Traffic Conditions

In order to establish 2017 thru 2021 project build-out traffic conditions, two forecasting methods were used.

The first traffic forecasting method was the County's traffic count data was adjusted for peak season conditions, peak hour conditions, peak direction, and an annual growth rate was then applied. The peak season/peak hour/peak direction factor as shown on Table 2B was derived from the 2017 Collier County AUIR Reports. The annual growth rate was also obtained from the 2017 AUIR Report. Using the annual growth rate, the 2021 background traffic conditions were determined, which are depicted in Table 2B.

The second traffic forecasting method was to add the vested trips (trip bank) identified in the 2017 AUIR report to the adjusted peak season, peak hour and peak direction traffic counts. The 2021 vested trips "+" background traffic volumes are depicted in Table 2B.

The greater of the two values produced by the two forecasting procedures was then considered to reflect the 2021 background traffic. The net new project generated traffic was then added to the background traffic. Table 2C provides a summary of the 2017 thru 2021 traffic conditions and the roadways' level of service and remaining available capacity. As shown, all project impacted roadways will continue to operate at the County's adopted minimum level of service thresholds at project build-out.
