TABLE OF CONTENTS

Conclusions

Based upon the findings of this report, it was determined that the proposed rezoning and future development of Santa Barbara Boulevard & Golden Gate Parkway Commercial Sub-District will not have a negative impact upon the surrounding road network. It was verified that all roads, within the project's area of influence, currently have a surplus of capacity and can accommodate the traffic associated with the proposed mixed-use commercial development that may consist of a gas-n-convenience store, fast food restaurants, and miscellaneous commercial retail land use. As determined, the road network will continue to operate at acceptable levels of service for 2021 project build-out conditions and will not create any off-site transportation deficiencies that need to be mitigated.

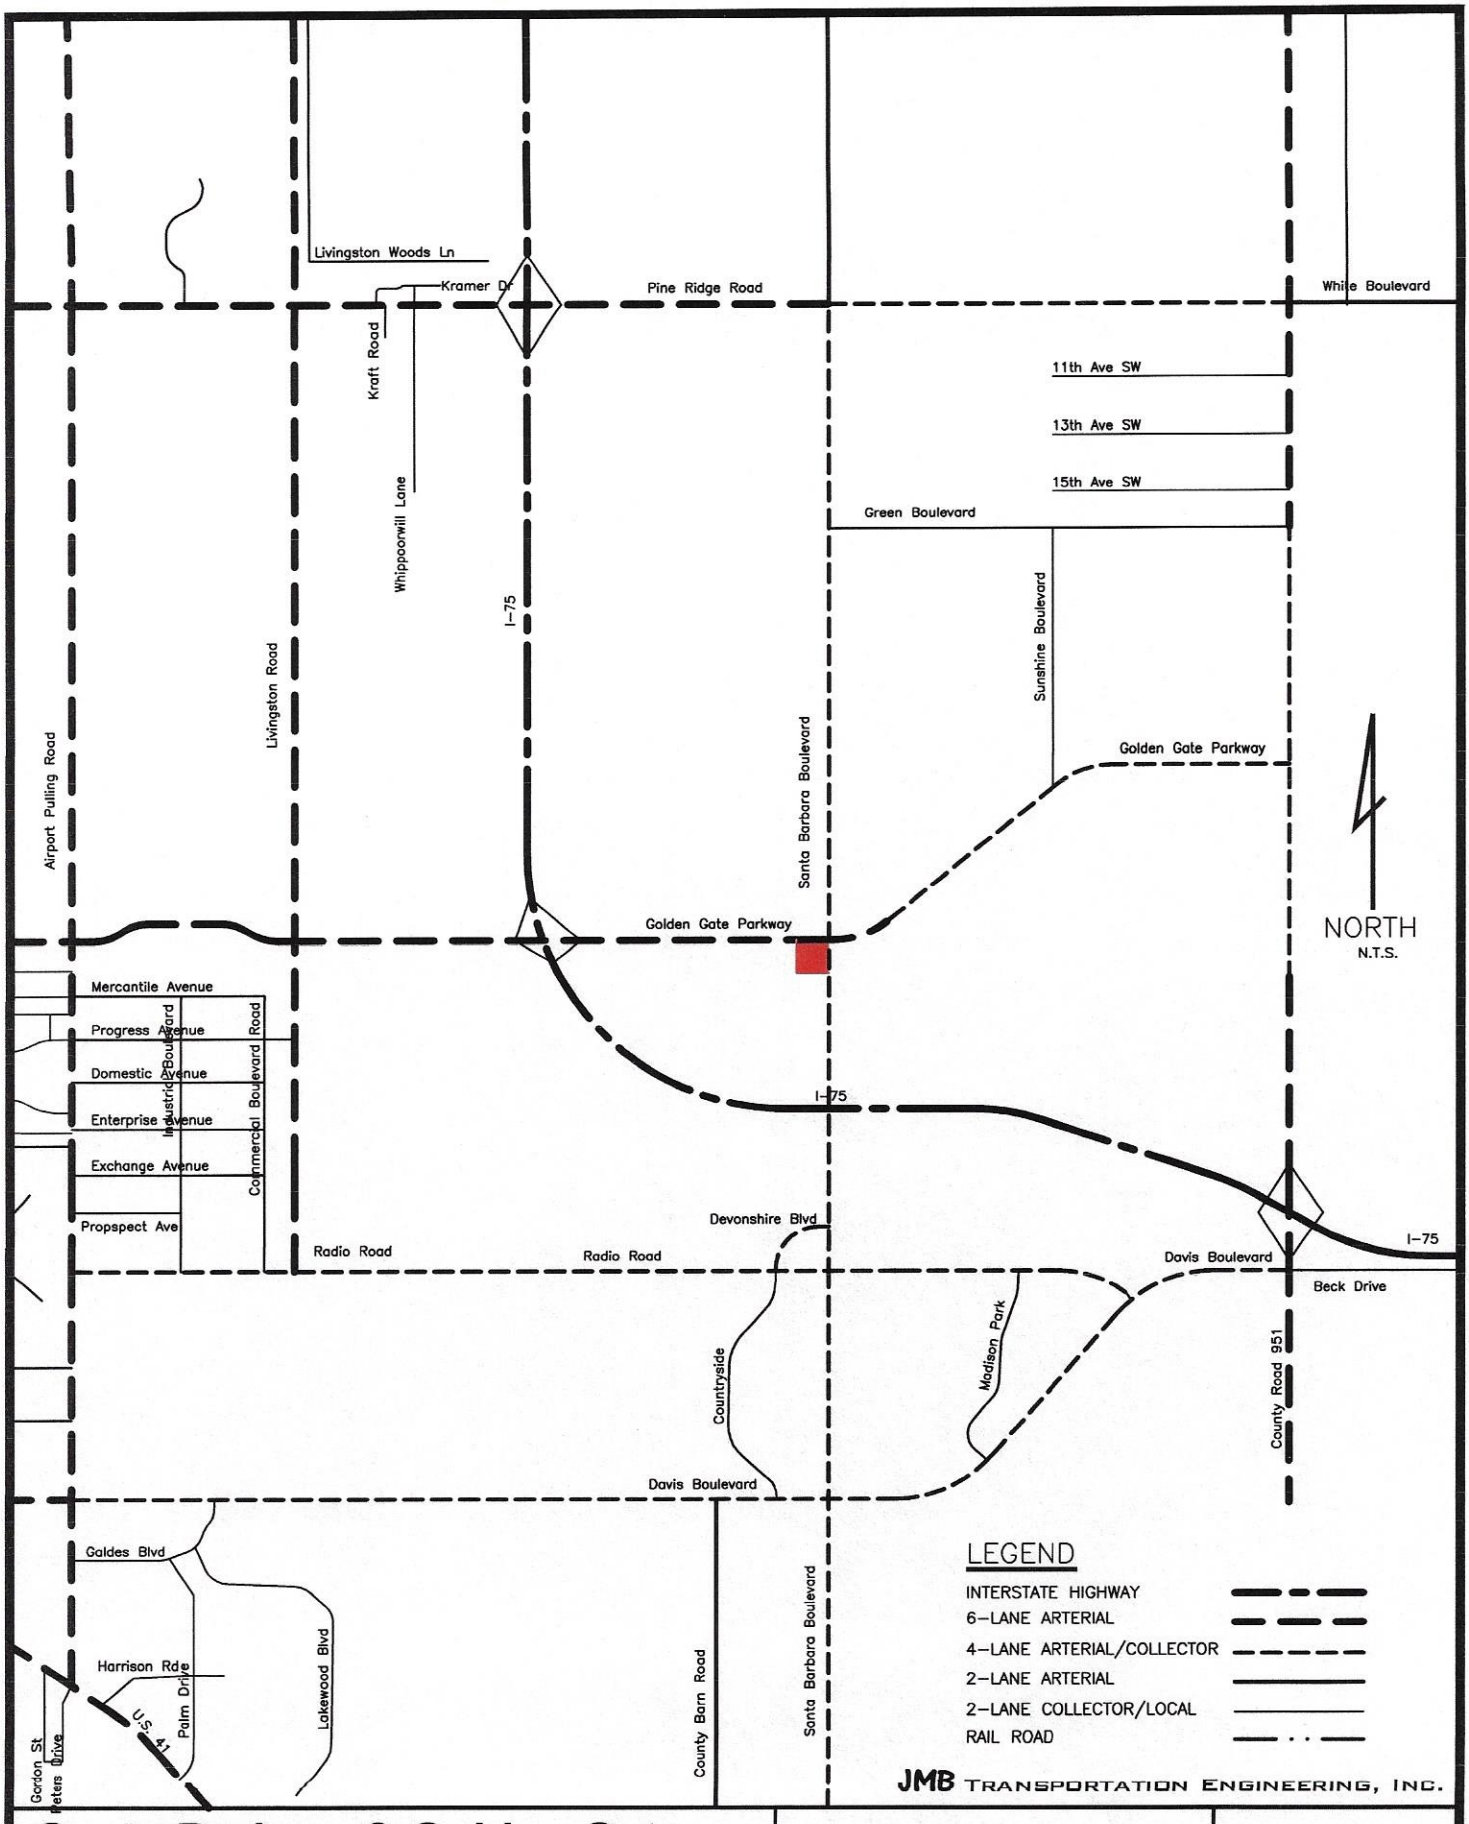
Note, site access conditions and off-site intersection impacts/mitigation will be evaluated at the time of acquiring SDP approval.

Scope of Project

Santa Barbara Boulevard & Golden Gate Parkway Commercial Sub-District is a proposed multi-use project that will consist of no more than 21,500 square feet of commercial land uses. It is proposed that the site may consist of a gas-n-convenience store (6,500 s.f. store & 16 fueling positions), fast food restaurants w/ drive thru (no more than 6,750 s.f.), and/or 21,500 s.f. of retail/office. The site is located on the southwest corner of Santa Barbara Boulevard & Golden Gate Parkway, within Collier County, Florida. It is proposed to have one (1) right-in/out access on Santa Barbara Boulevard and one (1) directional left-in median opening on Golden Gate Parkway.

Table A
Proposed Land Uses

Proposed Land Uses	Number of Units or Size
Retail/Office	up to 21,500 s.f.
Fast Food w/ Drive-Thru	No more than 6,750 s.f.
Gas n Convenience Store	6,500 s.f. & 16 Fuel Positions
Total	**Maximum 21,500 s.f.**



Santa Barbara & Golden Gate Commercial Sub-District

Project Location & Roadway Classification

FIGURE 1

Project Generated Traffic

Traffic that can be expected to be generated by the project was estimated based upon the guidelines established by the Institute of Transportation Engineers, Trip Generation Manual, 10th Edition. That is, historical traffic data collected at similar land uses was relied upon in estimating the project's traffic. It was determined that land use codes Variety Store" (LUC 814), "Fast Food w/ Drive-Thru" (LUC 934), and "Super Convenience/Gas Station" (LUC 960) were most representative of the most intense land uses that could be developed.

Table 1 provides a detail of the total estimated trips. As determined, the project could generate 4,681 new daily trips and 468 vph and 375 vph new trips during the AM and PM peak hours, respectively.

Table B
New Site-Generated Trips
(Summation of Table 1)

Daily New Weekday Trips Generated (ADT)	New AM Peak Hour Trips Generated (vph)	New PM Peak Hour Trips Generated (vph)
4,681	468	375

Existing + Committed Road Network
Figure 1 and Table 2A provide a detail of the surrounding E + C road network. Table 2A also shows the roads' respective minimum level of service performance standards and capacity. As shown, there are no significant 5-year committed roadway improvements within the project's area of impact.

Santa Barbra Boulevard varies from a four-lane to a six-lane major arterial that has a north/south orientation between its southern terminus at its intersection with Rattlesnake Hammock Road and its northern terminus at its intersection with Green Boulevard where the roadway continues north to Immokalee Road and is known as Logan Boulevard. Between Green Boulevard and Golden Gate Parkway, Santa Barbara Boulevard is classified as a four-lane divided arterial having a maximum service capacity of 2,100 vphpd. Between Golden Gate Boulevard and Rattlesnake Hammock Road, Santa Barbara Boulevard is classified as a six-lane divided arterial having a maximum service capacity of 3,100 vphpd. Within proximity of the site, the posted speed limit of Santa Barbara Boulevard is 45 MPH.

Golden Gate Parkway varies from a four-lane to a six-lane major arterial that has an east/west orientation between its western terminus at its intersection with U.S. 41 and its eastern terminus at its intersection with Collier Boulevard. Golden Gate Parkway (west of Santa Barbara Boulevard), is classified as a six-lane divided arterial having a maximum service capacity of 3,300 vphpd. Golden Gate Parkway (east of Santa Barbara Boulevard) is classified as a four-lane divided arterial having a maximum service capacity of 1,800 vphpd. Within proximity of the site, the posted speed limit of Golden Gate Parkway is 45 MPH.

Project Traffic Distribution
The project's traffic was distributed to the surrounding road network based upon logical means of ingress/egress, current and future traffic patterns in the area, and the location of surrounding residential areas as well as other schools was considered. Figure 2A and Table 2A provide a detail of the traffic distributions based on a percentage basis. Table 2A also depicts the traffic distributions by volume. Figure 2B depicts the trip assignments to the site access and nearby intersections.

Area of Significant Impact
The area of significant impact was determined based upon Collier County's 2%, 2% and 3% criteria (i.e., if the project's traffic is 2% or more of a roadway's adopted level of service capacity, then the project has a significant impact upon that link). Table 2A (AM) and Table 2A (PM) describe the project traffic distributions and the level of impact on the surrounding roadways for AM and PM peak hour conditions, respectively. Roads that were identified as being within the projects area impact are identified in Table 2A (AM and Table 2A (PM).

PROJECT-GENERATED TRAFFIC ASSIGNMENT

FIGURE 2B

2017 thru 2021 Project Build-out Traffic Conditions

In order to establish 2017 thru 2021 project build-out traffic conditions, two forecasting methods were used.

The first traffic forecasting method was the County's traffic count data was adjusted for peak season conditions, peak hour conditions, peak direction, and an annual growth rate was then applied. The peak season/peak hour/peak direction factor as shown on Table 2B was derived from the 2017 Collier County AUIR Reports. The annual growth rate was also obtained from the 2017 AUIR Report. Using the annual growth rate, the 2021 background traffic conditions were determined, which are depicted in Table 2B.

The second traffic forecasting method was to add the vested trips (trip bank) identified in the 2017 AUIR report to the adjusted peak season, peak hour and peak direction traffic counts. The 2021 vested trips "+" background traffic volumes are depicted in Table 2B.

The greater of the two values produced by the two forecasting procedures was then considered to reflect the 2021 background traffic. The net new project generated traffic was then added to the background traffic. Table 2C (AM) and Table 2C (PM) provide a summary of the 2017 thru 2021 traffic conditions and the roadways' level of service and remaining available capacity for AM and PM peak hour conditions, respectively. As shown, all project impacted roadways will continue to operate at the County's adopted minimum level of service thresholds at project build-out.
